

This code will throw errors. What change will fix those errors?

```
class Building
{
    private int x;
    private int y;
}

class Garage : Building
{
    public string ListValues()
    {
        return $"x: {this.x}, y: {this.y}";
    }
}
```

Change both **private** fields to **protected**.

Change both **private** fields to **override**.

Change both **private** fields to **virtual**.

Change both **private** fields to **abstract**.

Correct! Private members cannot be accessed by derived classes, but protected members can be.
