Given that **IMachine** is an interface, what does the first line mean?

```
class Tractor : IMachine
{}
```

There is one class named **Tractor : IMachine**.

Calling **Tractor()** will call **IMachine()**.

The **IMachine** interface implements the **Tractor** class.

The **Tractor** class implements the **IMachine** interface.

👏 Correct! The colon syntax indicates that the class on the left implements the interface(s) on the right.
